C7: C for set's operations

Dayanne Fernandes da Cunha

Department of Computer Science, University of Brasilia, Distrito Federal, Brasil 130107191@aluno.unb.br https://github.com/Dayof

Abstract. This language aims to enable set operations using C language syntax with an easy and natural notation.

Keywords: $C \cdot Language Processor \cdot Compiler \cdot Set.$

1 Proposal

Sets are a very common data structure in many fields, such as mathematics, biology, chemistry, computer science. It's basically a collection of elements that follows an certain property, and with them it's possible to describe many complex and simple problems. For example a set in mathematics can be use to describe geometrical shapes and algebraic components, in computer science it's used to perform logical operations that is fundamental to the computer existence itself.

This language aims to extend C language to support set operations with the news data types, **set** and **elem**, using C's syntax and inheriting it's semantics rules. In addition it will support simple arithmetic's operations, read and write commands, functions and flow structures. Further information about what syntax the compiler supports please read the Annex B. The book [ALSU06] will be used as a guide for the implementation of C7's compiler architecture.

2 Lexical Analyzer

2.1 Architecture

The lexical analyzer is called LEXER, this module receives a character stream, analysis it trying to find lexemes related to patterns and construct tokens to send to the parser module. The input needs to match the C7 formal grammar defined in Annex A, e.g. the input "var = 1 + 1" will generates the following output $\langle id, \text{ 'var'} \rangle \langle assign, \text{ '='} \rangle \langle integer, \text{ '1'} \rangle \langle add, \text{ '+'} \rangle \langle integer, \text{ '1'} \rangle$. The pair $\langle token, lexeme \rangle$ represents the information that will be send to the parser.

2.2 Error Handler

Tokens that are not recognized from any regular expression will be showed in the compiler output as a *LexerError*, showing the line and column indexes that this character/pattern was not correctly identified, e.g.:

```
columns |1|2|3|4|5|6|7|8|9|10|
line 1. |v|a|r|_|2| |+|=| |@|
```

The operator += above in line 1 will not be implemented in C7 according to the Annex B, so the parser will not understand += as an operator, but the lexer understand += as "add" and "assign", "+" and "=" respectively. Although += is recognized by the lexer, the character @ is not recognized, so the output for this case will be:

```
Line 1: <id, 'var_2'> <add, '+'> <assign, '='>
LexError: token '@' is not recognized in line 1, column 10.
```

The system doesn't exit immediately after a lexical error is found and emitted, instead, it recovers and search for other errors in the source code until the end of the characters stream.

2.3 Code Structure and Custom Functions

GCC, version 9.3.0 and FLEX [Pax] 2.6.4 were used to build the lexical analyzer. Some of the internal Flex functions were used to read a character stream from a file and define the tokens and patterns. This Flex definition of C7 is defined in the file lexer/c7.lex. All the important files concerning to the lexer analyser are located inside of the folder lexer.

The system starts with the function int main (int argc, char* argv[]) inside of the file **core/main.c** and reads a file as input. Every pattern recognized goes through a pipeline inside of the analyzer defined as follow: "{<PATTERN>} { handle_token(<PATTERN_TOK>); },". The function void handle_token(int token) is a switcher that is responsible to show the valid tokens, increment the lines and columns as the source code is read, in addition detects and show any lexical error that is found in the code.

2.4 Tests

The instructions to compile and run c7 are in the file README.md. After executing the usage steps, there are some files to test the lexical cases, e.g.:

Valid Lex The files "src/tests/lexer/valid_1.c7" and "src/tests/lexer/valid_2.c7" test valid patterns allowed by the language. For example, the following structure should be understood as valid by c7.

Invalid Lex The files "src/tests/lexer/invalid_1.c7" and "src/tests/lexer/invalid_2.c7" test invalid characters pattern not allowed by the language. For example, the following structure should be understood as invalid by c7.

Appendix A

Regex

```
nzerodigit := '1' | ... | '8' | '9'
digit := '0' | nzerodigit
letter
           := 'a' | ... | 'z' | 'A' | ... | 'Z'
whitespace := ' ' \t'
          := '\n'
newline
           := '+'
add
           := ',-'
sub
           := '*'
mult
           := '/'
div
           := add | sub | mult | div
operator
assign := '='
parent_left := '('
parent_right := ')'
brack_left := '{'
brack_right := '}'
semicolon := ';'
           := ','
comma
           := '||'
or_op
           := '&&'
and_op
not_op
          := '!'
boolean_op := '==' | '>=' | '<=' | '!=' | '>' | '<' | '<>' |
delimiter := '.' | ':' | '[' | ']'
         := '%' | '?' | '_' | '\\' | '\\' | '\\' | '\\' |
other_s
           := whitespace | newline | operator | boolean_op
symbols
                             | delimiter | parent_left |
                             parent_right | brack_left |
                             brack_left | semicolon | comma
                              | or_op | and_op | not_op |
                             other_s
         := '"' name_dq '"' | "'" name_sq "'"
string
          := "" | char_dq name_dq
name_dq
          := letter | digit | symbols | "'"
char_dq
          := "'" (name_sq)? "'"
          := letter | digit | symbols
name_sq
          := nzerodigit digit* | '0'
integer
          := [digit]+"."digit+
